

ALL-NEW LINCOLN AVIATOR GRAND TOURING HYBRID

The all-new Lincoln Aviator was designed with electrification in mind right from the start. For the first time, Lincoln combines the power of a gas engine with an electric motor for near instantaneous torque. Lincoln Aviator Grand Touring uses a 3.0-liter twin-turbocharged V6 engine with advanced electrified technology to deliver a projected 600 lb.-ft. of torque and a targeted 450 horsepower.

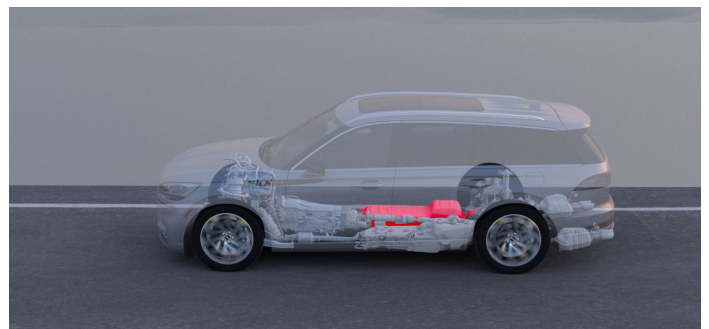

Lincoln Drive Modes: Lincoln drive modes allow clients to further customize the driving experience, while the 12.3-inch configurable LCD instrument cluster that comes standard confirms the choice with beautiful, easy-to-read dynamic graphics and prompts.

Two new modes, in addition to Lincoln's signature Normal, Conserve, Excite, Slippery and Deep Condition, are engineered specifically for the Aviator Grand Touring. Pure EV and Preserve EV modes allow clients to choose when and how to best use their electric energy.

- *Pure EV* – designed to keep the driver in all-electric mode in most conditions. Should demand exceed what electric mode can deliver, the driver receives a prompt indicating the gas engine is taking over
- *Preserve EV* – designed to sustain the charge to be used later

The Grand Touring edition offers Lincoln's most advanced hybrid technology, merging effortless power and performance with outstanding fuel efficiency and range.

*Cargo and load capacity limited by weight and weight distribution.

Packaging: Innovative under-floor battery packaging in Aviator Grand Touring allows for advanced technology without sacrificing cargo space*. Clients can fit four golf bags behind the second row with no need to stack them when the third row is folded. Additionally, the vehicle maintains its 19-gallon fuel tank and spare tire.

Charging Options: Aviator Grand Touring will be equipped with a standard charge cord. It is capable of accepting a level 1 or level 2 charge. Owners will get a full charge within three to four hours using 240 volts at a public charging station, home-installed charging station or with a level 2 charge cord.

Aviator Grand Touring offers the best of both worlds, running on electric power when the driver wants it and gasoline when it's needed.
